

Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is a device constructed out of top quality materials meant to withstand the most difficult operations and work environments. This particular piece of equipment can enable the one driving to maneuver the blades hydraulically without leaving the seat. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate much more accurate carrying and placement in a faster and more efficient method.

The fork pocket is somewhat unique and can enable the individual operating it to be able to securely sway the forks into position without any fear of damaging the positioning cylinders. This could allow the operator the option to be able to execute independent or simultaneous fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be transformed into fork positioners on existing units.
